

# Utilizing Telehealth Medicine to Deliver Diabetes Education

Uzoamaka Onyedebelu, MBA, FNP-C, DNP  
Touro University Doctor of Nursing Program

## Background

- Diabetes mellitus is a commonly managed condition in the primary care setting
- Healthcare expenditures related to diabetes places a financial burden on the healthcare system
- Knowledge deficit is the primary cause of diabetes-related complications
- Primary care providers can limit complications
- Diabetes self-management education (DSME) can lead to change in self-care behaviors
- Dorothea Orem's self-care deficit theory

## Purpose

- Improve provider identification of patients that may benefit from telehealth diabetes self management education (DSME) from the development of an assessment tool
- Develop and implement a telehealth guided protocol.
- Provide healthcare providers with a training session on the DSME protocol
- Improve patient understanding of DSME and self-care management of DM.

## Methods

- Quality improvement (QI) project was performed at a local community clinic in an underserved area with patient ethnicities that included Hispanics, African-Americans, and Caucasians
- Three nurse practitioners (NPs) were staff members of the clinic and were chosen as project participants
- Each NP selected 9-10 patients for a total of 28 patients that would receive telehealth diabetes self-management education from the NPs
- Patients selected by the NPs had a diagnosis of diabetes for at least 12 months or greater
- Patients that were not selected could not be diagnosed less than twelve months ago or have not Type 1 Diabetes
- 14 patients received DSME
- 14 patients will not receive DSME
- The following tools were used in the QI project:
  - Patient Diabetes Questionnaire (PDQ)
  - Nurse Practitioner (NP) Competency Evaluation - Framework
  - Telehealth Sessions – 3-session Program Manual
  - Chart Audit Tool

- Project implementation spanned a period of five weeks
- NPs completed a PDQ for each patient in both groups – DSME group and non-DSME group during initial (Week 1) and post implementation (Week 5) clinic visits
- NPs scheduled patients for telehealth sessions via video calls or regular calls (Week 1)
- Non-DSME group had routine clinic visits (Week 1 and Week 5)
- Intervention groups had three DSME telehealth sessions (Week 2, Week3, and Week 4)
- PDQ scores were put in a SPSS codebook for pre-implementation and post-implementation scores
- Scores between pre and post were compared using the chi test for independence
- Analyzed scores to determine effectiveness of quality improvement

## Results

- Non-DSME group:
  - Approximately 14.3% of patients experienced high blood sugar readings on a daily basis pre and post implementation
- DSME group:
  - 85.7% of patients that reported that they were aware of the target range for their blood glucose pre-implementation (Table 1). This increased to 100% awareness post-implementation (Table 2).
  - There was a decrease in the number of patients who reported high blood sugar readings on a daily basis. This decreased from 35.7% to 21.4% (Table 3-4).
  - There were 7.1% patients in the pre-contemplation phase of weight loss (Table 5). The post-implementation assessment conducted by the NPs showed that there were 14.3% in the preparation phase (Table 6).

Group	Item	Pre-Implementation		Post-Implementation	
		Count	%	Count	%
Non-DSME	Know target range for blood glucose	2	14.3%	2	14.3%
	Do not know target range for blood glucose	12	85.7%	12	85.7%
	Know target range for blood glucose	1	7.1%	1	7.1%
	Do not know target range for blood glucose	13	92.9%	13	92.9%
DSME	Know target range for blood glucose	12	85.7%	14	100%
	Do not know target range for blood glucose	2	14.3%	0	0%
	Know target range for blood glucose	1	7.1%	1	7.1%
	Do not know target range for blood glucose	13	92.9%	13	92.9%
Total	Know target range for blood glucose	14	50%	16	57.1%
	Do not know target range for blood glucose	14	50%	12	42.9%

Group	Item	Pre-Implementation		Post-Implementation	
		Count	%	Count	%
Non-DSME	Know target range for blood glucose	2	14.3%	2	14.3%
	Do not know target range for blood glucose	12	85.7%	12	85.7%
	Know target range for blood glucose	1	7.1%	1	7.1%
	Do not know target range for blood glucose	13	92.9%	13	92.9%
DSME	Know target range for blood glucose	12	85.7%	14	100%
	Do not know target range for blood glucose	2	14.3%	0	0%
	Know target range for blood glucose	1	7.1%	1	7.1%
	Do not know target range for blood glucose	13	92.9%	13	92.9%
Total	Know target range for blood glucose	14	50%	16	57.1%
	Do not know target range for blood glucose	14	50%	12	42.9%

Group	Item	Pre-Implementation		Post-Implementation	
		Count	%	Count	%
Non-DSME	High blood sugar readings on a daily basis	5	35.7%	3	21.4%
	Low blood sugar readings on a daily basis	9	64.3%	11	78.6%
	High blood sugar readings on a daily basis	1	7.1%	1	7.1%
	Low blood sugar readings on a daily basis	13	92.9%	13	92.9%
DSME	High blood sugar readings on a daily basis	2	14.3%	1	7.1%
	Low blood sugar readings on a daily basis	12	85.7%	13	92.9%
	High blood sugar readings on a daily basis	1	7.1%	1	7.1%
	Low blood sugar readings on a daily basis	13	92.9%	13	92.9%
Total	High blood sugar readings on a daily basis	7	25%	4	14.3%
	Low blood sugar readings on a daily basis	21	75%	24	85.7%

Group	Item	Pre-Implementation		Post-Implementation	
		Count	%	Count	%
Non-DSME	High blood sugar readings on a daily basis	5	35.7%	3	21.4%
	Low blood sugar readings on a daily basis	9	64.3%	11	78.6%
	High blood sugar readings on a daily basis	1	7.1%	1	7.1%
	Low blood sugar readings on a daily basis	13	92.9%	13	92.9%
DSME	High blood sugar readings on a daily basis	2	14.3%	1	7.1%
	Low blood sugar readings on a daily basis	12	85.7%	13	92.9%
	High blood sugar readings on a daily basis	1	7.1%	1	7.1%
	Low blood sugar readings on a daily basis	13	92.9%	13	92.9%
Total	High blood sugar readings on a daily basis	7	25%	4	14.3%
	Low blood sugar readings on a daily basis	21	75%	24	85.7%

## Conclusion

- Telemedicine is a powerful approach to transform delivery of healthcare services.
- Telemedicine makes it possible for healthcare practitioners to provide care to their patients inside and outside the clinic setting.
- Telehealth DSME improves patient outcomes, increases organizational revenue, increases patient satisfaction, and improves the overall health care system.
- Satisfaction scores increased from 75% to 92% at this clinic
- Telemedicine will ultimately complement many primary care practices as it can help with early detection and effective monitoring of the progression of the disease.
- Orem's self-care theory applicability to DSME and the necessity for providers to provide education that encourages self care agency for effective long-term management of diabetes
